

NETFLIX CONTENT ANALYSIS

Detailed dashboard analysis, KPIs, content mix, geography, genres, ratings, directors and time trends

Figure 1. Netflix Content Analysis Dashboard — supplied dashboard overview.

Report Element	Details
Project	Netflix Content Analysis Dashboard
Business Domain	Entertainment / Streaming Content
Primary Objective	Understand catalog composition, geographic concentration, ratings, genres, directors and release-year trends
Dashboard Total Titles	15,320
Movies	14,873
TV Shows	447
Analysis Basis	Supplied dashboard screenshots and visible dashboard metrics
Name	Aashish Kapadia

1. Executive Summary

This project presents a Netflix Content Analysis dashboard designed to understand the composition and evolution of a streaming content catalog. The supplied dashboard reports 15,320 total titles, consisting of 14,873 movies and 447 TV shows. The movie category therefore dominates the catalog, while TV shows form a comparatively small portion.

The dashboard combines KPI cards, a Movies vs TV Shows comparison, rating distribution, release-year trends, country concentration, genre analysis, director rankings, runtime distributions, TV-show season distributions and monthly content-addition analysis. Together, these visuals provide a broad view of what content is present, where it comes from, what ratings and genres dominate, and how the catalog changed over time.

The strongest portfolio-level insight is the scale of the movie catalog relative to TV content. The country view also shows a strong concentration in the United States, followed by India and the United Kingdom. Genre analysis is led by Dramas and International Movies, while the rating chart is dominated by TV-MA, TV-14 and R.

The time-series visuals indicate that catalog additions accelerated sharply in the 2010s, reaching the highest visible levels around 2018–2019 before declining in the final displayed years. This pattern should be interpreted as the number of titles added to the dataset/catalog by year, not as a measure of content quality or audience demand.

2. Business Problem

A streaming-content catalog contains multiple dimensions that need to be analyzed together: content type, maturity rating, country, genre, director, runtime, TV seasons and release/addition timing. A simple title count does not explain how the catalog is structured or where the largest concentrations occur.

The dashboard addresses the following business questions:

- How large is the catalog and how is it divided between movies and TV shows?
- Which content ratings contribute the largest number of titles?
- Which countries contribute most of the catalog?
- Which genres appear most frequently?
- Which directors have the highest title counts in the supplied data?
- How are movie runtimes distributed?
- How are TV shows distributed by season count?
- Which months show the highest content additions?
- How has the number of titles changed by release year?

These questions are relevant to catalog planning, regional content strategy, maturity-rating management, recommendation design, editorial curation and portfolio reporting.

3. Dataset & Methodology

The analysis in this report is grounded in the supplied Netflix dashboard visuals. The dashboard visibly uses fields and dimensions including Type, Rating, Country, Listed In / Genre, Director, Duration, Release Year and Month Name. The report preserves the terminology shown in the dashboard rather than replacing it with alternative definitions.

The methodology is descriptive and diagnostic. Counts shown directly on KPI cards or visually readable chart scales are treated as dashboard observations. Where a chart does not print an exact value for every category, the discussion uses approximate values or relative ranking rather than presenting an invented exact number.

Project Element	Details
Primary subject	Netflix content catalog
Main measure	Count of titles / records
Content type	Movie, TV Show
Ratings	TV-MA, TV-14, R, PG-13, TV-PG, PG, TV-G, NR, TV-Y7, TV-Y, G, UR, NC-17, TV-Y7-FV
Geographic dimension	Country
Content classification	Listed In / Genre
Time dimensions	Release Year and Month Name
Additional dimensions	Director and Duration

Important validation point: several visuals display a large number of categories in one chart. Therefore, the dashboard is most useful for identifying patterns, rankings and concentration rather than reading every small category as a precise standalone number.

4. Key Performance Indicators

KPI	Dashboard Value	Interpretation
Total Titles	15,320	Overall catalog size represented in the dashboard
Movies	14,873	Very large majority of the catalog
TV Shows	447	Much smaller share compared with movies
Movies share	≈97.1%	14,873 / 15,320 based on dashboard KPIs
TV Shows share	≈2.9%	447 / 15,320 based on dashboard KPIs

The calculated shares above are derived directly from the three visible KPI counts. They are included to make the dashboard comparison easier to interpret; the underlying dashboard itself presents the raw counts.

5. Dashboard Analysis

5.1 Movies vs TV Shows

The donut chart shows an overwhelmingly larger Movie segment and a very small TV Show segment. This aligns with the KPI cards: 14,873 movies versus 447 TV shows. The dashboard therefore represents a catalog whose breadth is strongly driven by film titles.

Figure 2. Movies vs TV Shows — supplied dashboard visual.

5.2 Content by Rating

The rating chart is concentrated in a few major categories. TV-MA is the largest visible category at roughly five thousand titles, followed by TV-14 at roughly 3.4 thousand and R at roughly 2.4–2.5 thousand. PG-13 and TV-PG form the next major groups. The remaining ratings contribute much smaller counts.

This indicates that mature and teen-oriented classifications make up a substantial portion of the visible catalog. However, rating counts should not be interpreted as popularity, viewing hours or audience satisfaction because the chart measures content quantity.

Figure 3. Content by Rating — supplied dashboard visual.

5.3 Titles Added Per Year

The release-year trend remains relatively low for older decades, then rises gradually and accelerates strongly after the 2000s. The largest visible spike occurs around 2018–2019, with the line reaching approximately 1,800–1,900 titles at the peak before dropping in the final displayed years.

The sharp increase is consistent with a period of rapid catalog expansion in the supplied data. The decline at the end of the series should be treated carefully because the final years may represent incomplete periods or a different observation window.

Figure 4. Runtime Distribution and Content Added Based on Year — supplied dashboard visuals.

5.4 Geographic Concentration

The Top 10 Country visual is led by the United States, with approximately 4,700 titles. India is second at around 2,500–2,600, followed by the United Kingdom at approximately 1,000. France, Canada and Spain form the next tier, while Germany, Japan, China and Nigeria have smaller visible counts.

Figure 5. Top 10 Country — supplied dashboard visual.

5.5 Genre, Director, Duration, Seasons and Month

The dashboard also contains a detailed grid of the remaining dimensions. Dramas and International Movies are the two largest genre categories. The director ranking is led by Youssef Chahine, followed by Cathy Garcia-Molina and Martin Scorsese. The monthly view shows October as the highest visible month, with January and December also among the stronger months.

Figure 6. Genre, Director, TV Show Seasons and Monthly Content Addition views — supplied dashboard visual.

6. Category / Dimension Analysis

Dimension	Main Categories / Leaders	Portfolio Interpretation
Type	Movie, TV Show	Catalog is heavily movie-led
Rating	TV-MA, TV-14, R	Mature/teen ratings dominate visible counts
Genre	Dramas, International Movies, Comedies	Drama and international content are especially prominent
Country	United States, India, United Kingdom	Catalog is geographically concentrated
Director	Youssef Chahine, Cathy Garcia-Molina, Martin Scorsese	A small set of directors has relatively high title counts
Duration	Minute-based movie runtimes	Runtime distribution is highly dispersed, with many shorter and mid-length titles
TV Seasons	1 Season, 2 Seasons, 3 Seasons, etc.	Shorter TV series are common in the visible distribution
Month	Jan–Dec	Content additions vary by month

The dashboard is strongest when these dimensions are considered together. For example, country and genre can support regional catalog analysis, while rating and duration can support editorial segmentation.

7. Regional / Country Analysis

The country ranking demonstrates a pronounced geographic concentration. The United States is clearly the largest contributor in the Top 10 view. India forms the second major contributor, while the United Kingdom is a distant third. France and Canada occupy the next tier.

Country	Approx. Visible Count	Observation
United States	≈4,700	Largest country segment
India	≈2,550	Second-largest contributor
United Kingdom	≈1,000	Third-largest contributor
France	≈700–750	Strong European contribution
Canada	≈600	Major North American contributor
Spain	≈400	Moderate contribution
Germany	≈350–400	Moderate contribution
Japan	≈300	Smaller but visible Asian contribution
China	≈250	Smaller contribution
Nigeria	≈200–250	Smallest of the displayed Top 10

These values are approximate because the country chart is primarily a visual ranking rather than a printed data table. The strategic implication is the clear importance of the United States and India within the displayed catalog.

8. Customer / User Analysis

This project does not provide customer-level behavior metrics such as subscribers, watch hours, completion rate, churn or customer satisfaction. Therefore, the appropriate interpretation is catalog-oriented rather than customer-oriented.

From a business intelligence perspective, the dashboard can still support customer-facing decisions indirectly. Content mix, rating, genre, country, runtime and season count are important dimensions that can feed recommendation systems, editorial collections, localization strategies and audience segmentation.

- Use genre and rating as content-discovery dimensions.
- Use country to support regional catalog and localization decisions.
- Use duration and season count to distinguish short-form and long-form viewing options.
- Use release-year trends to understand the historical shape of catalog additions.

9. Usage & Addiction Analysis

Unlike a behavioral social-media dataset, the supplied Netflix dashboard does not contain user-level usage or addiction measures. It should therefore not be used to claim that a particular genre, rating or country causes higher viewing frequency or addiction.

The appropriate business interpretation is content availability and catalog structure. If viewing-hours or user-engagement data were added later, the existing dimensions could be used to compare content supply with actual consumption.

Potential Future Metric	Purpose
Watch Hours	Measure actual consumption by title/category
Completion Rate	Assess how much content is completed
Average Viewing Session	Understand session depth
Repeat Viewing	Identify rewatch behavior
Engagement by Genre	Compare supply with demand
Regional Viewing Hours	Compare country-level content availability with consumption

10. Key Business Findings

1. The catalog is overwhelmingly movie-led, with 14,873 movies compared with 447 TV shows.
2. The visible rating distribution is concentrated in TV-MA, TV-14 and R, showing a substantial mature/teen-rated content base.
3. The United States is the largest country contributor, followed by India and the United Kingdom.
4. Dramas and International Movies are the two largest visible genre categories.
5. The release-year trend shows rapid catalog expansion during the 2010s, peaking around 2018–2019 in the displayed series.
6. The director chart indicates that a relatively small group of directors accounts for the highest title counts in the supplied data.
7. Movie runtimes are widely distributed, while TV shows are heavily represented by lower season counts.
8. Monthly additions vary, with October appearing as the highest visible month in the supplied month chart.

11. Business Recommendations

9. Build regional content strategies around the strongest country markets while monitoring diversification opportunities.
10. Use rating-based filters and collections to improve content discovery for different audience maturity groups.
11. Create genre-led editorial collections, especially around Drama, International Movies and Comedy.
12. Use duration and TV season count as recommendation filters for users seeking quick viewing versus longer commitments.
13. Track catalog additions over time and distinguish genuine annual trends from partial-year effects at the end of the series.
14. Combine catalog supply with viewing data before making decisions about content investment or audience demand.
15. Maintain a consistent KPI layer so future dashboard versions can compare total titles, content type and regional mix over time.

12. Technical Skills Demonstrated

Skill Area	Demonstrated Use
Data Visualization	KPI cards, donut chart, bar charts and time-series visuals
Dashboard Design	Multi-view dashboard combining overview and detailed analysis
Dimensional Analysis	Type, Rating, Country, Genre, Director, Duration and Month
Time-Series Analysis	Release Year and content-addition trend
Ranking Analysis	Top 10 Country, Top 12 Genres and Top 10 Director
Business Storytelling	Turning dashboard observations into findings and recommendations
Data Interpretation	Using exact KPI values and approximate chart readings appropriately

The project is particularly useful in a data-analyst portfolio because it demonstrates the ability to move from a dashboard visual to a structured business narrative without confusing content counts with customer behavior.

13. Limitations & Validation

- The report is based on the supplied dashboard visuals; not every underlying record is visible in the screenshots.
- Several charts use visual scales, so category-level values are approximate unless directly shown by a KPI.
- The dashboard measures catalog/title counts, not views, watch time, revenue or customer satisfaction.
- The final years in the release-year series may represent an incomplete observation period; the decline should therefore be validated before using it for forecasting.
- Country and genre counts may reflect multi-valued source fields, so category totals may not necessarily sum to the total title count.
- The report does not infer causality from the descriptive charts.

Recommended validation checks for a production version include reconciling total distinct titles, checking null and duplicate records, validating multi-valued Country and Listed In fields, confirming the definition of Release Year versus date added, and checking whether the final year is complete.

14. Conclusion

The Netflix Content Analysis dashboard provides a strong catalog-level view of a large and diverse content library. Its most important headline is the dominance of movies over TV shows, supported by the 15,320-title total and the 14,873-to-447 split.

The dashboard also reveals meaningful concentration by rating, country and genre. The United States and India are especially prominent geographic contributors, while Drama and International Movies are leading genre categories. The time-series view adds another layer by showing the rapid expansion of catalog additions in the 2010s.

For portfolio purposes, the project demonstrates practical data visualization, dimensional analysis, ranking, time-series interpretation and business storytelling. The next level of analysis would connect the catalog structure to actual viewing behavior, allowing the business to compare content supply with demand.

15. Portfolio Project Summary

Portfolio Element	Recommended Text
Project Title	Netflix Content Analysis Dashboard
Domain	Entertainment / Streaming
Business Question	What does the Netflix catalog look like by type, rating, country, genre, director, duration and time?
Key KPI	15,320 total titles
Main Insight	Movies dominate the catalog; the United States and India are major country contributors; Drama and International Movies lead genres
Tools / Techniques	Dashboard visualization, KPI analysis, categorical ranking, time-series analysis
Portfolio Value	Demonstrates end-to-end descriptive analytics and business storytelling

Suggested portfolio presentation line: “Analyzed a 15,320-title Netflix content catalog to identify content-type mix, rating concentration, geographic distribution, genre leaders, director concentration and catalog-addition trends.”

Appendix – Suggested KPI / DAX Definitions

The following are conceptual DAX patterns that can be adapted to the actual field names in the source model. They are not claimed to be the exact formulas used in the supplied dashboard.

Metric	Conceptual Definition
Total Titles	DISTINCTCOUNT of the title identifier, or COUNTROWS if each row is one unique title
Movies	CALCULATE([Total Titles], Type = "Movie")
TV Shows	CALCULATE([Total Titles], Type = "TV Show")
Movie Share	DIVIDE([Movies], [Total Titles])
TV Show Share	DIVIDE([TV Shows], [Total Titles])
Titles by Country	[Total Titles] evaluated in Country filter context
Titles by Genre	[Total Titles] evaluated in Listed In / Genre filter context
Titles by Release Year	[Total Titles] evaluated in Release Year filter context
